Outline

- Understand Calculation Groups
- Conditional Calculation Items
- Drill-Through Interaction

Understand Calculation Groups

The case for calculation groups

Often, the same DAX code is reused multiple times

Calculation groups enables reuse of DAX code

Groups of calculation items

these KPIs year-to-

date next to it!

About calculation items

- Each calculation item is a DAX formula.
- Each calculation item corresponds to a row in the calculation group table.
 - Filtering the table selects the calculation item to apply
 - When this happens, measures are wrapped in the item's DAX formula through the SELECTEDMEASURE function.

Using multiple calculation groups

- It is possible to have multiple active calculation groups.
- In this case, the order in which the calculations are done is relevant.
- Therefore, the *precedence* of a calculation group can be set.

" SO, WHO WOULD YOU LIKE ME TO CALL FIRST, DEAR, THE PLUMBER OR THE EXTERMINATOR?"

Dynamic formatting

- By default, the calculation item uses the formatting of the selected measure.
- This can be changed by selecting a dynamic format string.
- Each calculation item can have its own format
 - Note that this is a DAX expression!
 - A format string can be based on the selected measure's format using the SELECTEDMEASUREFORMATSTRING function.

DEMO

Conditional Calculation Items

A calculation item is a filter

- It acts on every measure in scope no exceptions.
- It is included in interactions as well, like cross-visual interaction.
- So, we need a way to exclude measures.

DEMO

Drill-Through Interaction

Drill-Through Interaction

- Suppose you have an overview page where the user can choose between different views: per month, year-to-date, etc.
- And a drill-through page to look at the specifics, but here you want to see all the details
- So, a drill-through page with Keepallfilters-except-the-Calculation-Item-filter
- How to solve this?

DEMO
